

# Copilot Studio: Enterprise Agent Platform

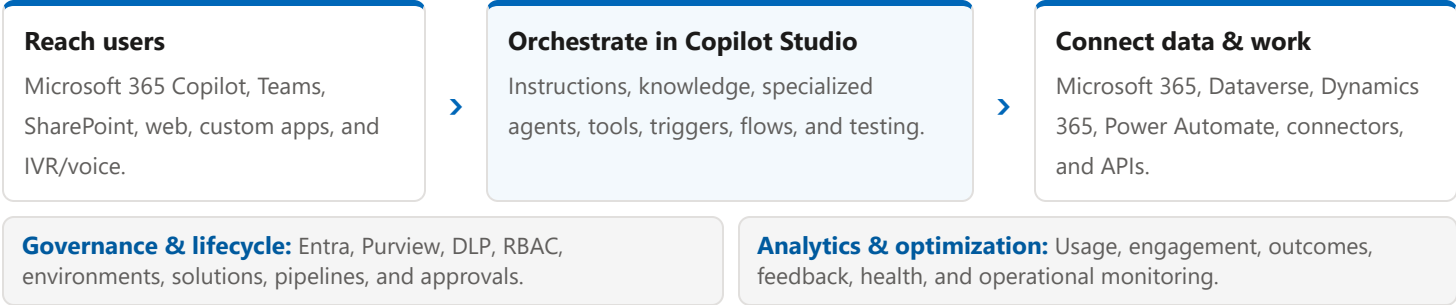

Build agents where people already work, connect them to governed enterprise data and business actions, and operate them at scale through one integrated Microsoft platform.

**Strong fit when** Your organization wants to extend Microsoft 365 and Power Platform, move from answers to actions, support makers and developers, and manage agents through a consistent enterprise lifecycle.

## Why organizations choose Copilot Studio

| Business value                         | How Copilot Studio delivers                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Meet users where they work             | Publish to Microsoft 365 Copilot, Teams, SharePoint, websites, custom apps, and other channels from the same agent platform.                                                   |
| Connect governed business context      | Ground agents in Microsoft 365 and SharePoint, connect Graph-indexed sources and APIs, and use Dataverse and Dynamics 365 for secured operational data and processes.          |
| Turn conversations into action         | Retrieve data and complete work through agent flows, Power Automate, prebuilt and custom connectors, APIs, and line-of-business systems.                                       |
| Support voice and self-service         | With Dynamics 365 Contact Center or Customer Service voice capabilities, create IVR agents with speech and DTMF input, call-flow control, and representative handoff.          |
| Orchestrate agents and autonomous work | Delegate tasks to specialized agents and use triggers, instructions, flows, permissions, and guardrails to respond to events and execute workflows.                            |
| Govern the full lifecycle              | Apply Entra authentication, Purview, DLP, RBAC, admin approvals, and managed environments; move agents through development, test, and production with solutions and pipelines. |
| Measure and improve                    | Use built-in analytics for usage, engagement, outcomes, feedback, and channel performance, with options for custom reporting and telemetry.                                    |
| Unite low-code and pro-code teams      | Start with natural-language and visual authoring, then extend with custom connectors, APIs, Azure services, source control, and CI/CD tooling.                                 |
