

# Choose how agent usage is funded and controlled

Compare prepaid capacity, tenant spillover, pay-as-you-go, and Microsoft 365 Copilot inclusion — then decide how each environment should behave when usage exceeds its plan.

Know the difference

Capacity allocation assigns a budget, Azure budgets send alerts, and per-agent limits can stop usage. These are separate controls.

## Billing configurations and overage behavior

| Configuration                   | How capacity is assigned                                                         | When planned capacity is used                                                                                                                                                                      | Azure charge?                 | Hard stop?                                                            |
|---------------------------------|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------------------------------------------------------------|
| Prepaid only<br>No fallback     | Tenant-pooled credits are allocated to the environment.                          | Enters overage with no PAYG path. Custom agents can continue during the enforcement grace period and may later be disabled. Monthly usage resets; overage isn't deducted from the next allocation. | No                            | Not exact<br>Not at the environment allocation.                       |
| Prepaid +<br>Tenant spillover   | Environment allocation plus available tenant prepaid capacity.                   | Draws from the remaining tenant pool after its allocation. This can consume capacity that might otherwise serve other agencies.                                                                    | No                            | Not exact<br>Prepaid enforcement applies after capacity is exhausted. |
| PAYG only                       | The environment is linked to an Azure billing plan.                              | Every billable Copilot Credit is metered to Azure. Usage continues until the agent or billing path is stopped, or an applicable agent limit is reached.                                            | Yes<br>All billable usage.    | Agent level<br>No aggregate environment cap.                          |
| Prepaid +<br>PAYG overage       | Prepaid allocation first; linked Azure plan covers overage.                      | Additional usage is billed to Azure after prepaid capacity is consumed, preserving service continuity.                                                                                             | Yes<br>Overage only.          | Agent level<br>No aggregate environment cap.                          |
| Prepaid +<br>Both fallbacks     | Environment allocation, tenant capacity, and linked PAYG.                        | Both tenant capacity and PAYG can cover overage. Public documentation doesn't state a guaranteed priority. This is the least strict agency allocation.                                             | Partial<br>PAYG-billed usage. | Agent level<br>No aggregate environment cap.                          |
| Microsoft 365 Copilot inclusion | Qualifying employee-facing usage is included for an authenticated licensed user. | Included usage is zero-rated. Nonincluded scenarios use the configured prepaid or PAYG path. Fair-use and service limits still apply.                                                              | Depends<br>On the scenario.   | Service limits<br>Not a budget cap.                                   |

## What each control actually does

|                                                                                                                   |                                                                                                                          |                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Environment allocation</b><br>Assigns a planned share of prepaid tenant capacity. It isn't an exact hard stop. | <b>Draw from tenant</b><br>Lets an environment use available shared prepaid credits after its allocation.                | <b>Bill to PAYG</b><br>Sends applicable usage or overage to the linked Azure subscription.                               |
| <b>Azure budget</b><br>Sends actual or forecasted cost alerts. It doesn't stop agents or PAYG consumption.        | <b>Per-agent monthly limit</b><br>Can notify admins and automatically turn off that agent at its limit, where available. | <b>Disable or disconnect</b><br>Stops the agent or removes the PAYG path; another valid capacity path might be required. |

## Recommended agency patterns

|                                                                               |                                                                                   |                                                                                   |                                                                                                |
|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>Strict control</b><br>Prepaid, no tenant spillover, plus per-agent limits. | <b>Shared central pool</b><br>Prepaid with tenant spillover and close monitoring. | <b>Clean chargeback</b><br>One PAYG billing plan per agency and its environments. | <b>Business continuity</b><br>Prepaid baseline, agency PAYG overage, alerts, and agent limits. |
